On-farm Strip Trials

The adoption of Bayesian approaches simplifies the interpretation of the results and augments the inference [Che et al. , 2010].

Compared with REML, Baek, et al. [2019] demonstrate the advantages in terms of variation control and powerful inference.

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ・ つ へ ()

It is a complementary approach to GWR.

Does the new model differ from GWR?

We rewrite the GWR model as:

$$y_i = \beta_0 + \beta_1 N_i + \beta_2 N_i^2 + (u_{0i} + u_{1i} N_i + u_{2i} N_i^2) + e_i, \quad (1)$$

where N_i is the nitrogen level at location s_i . The random term incorporates a spatial covariance matrix V_s such that

$$\Sigma_u = V_s \otimes V_u. \tag{2}$$

 V_s could be $AR1(\rho_r) \otimes AR1(\rho_c)$, Gaussian random field, or nearest neighbour distance (similar to GWR).

On-farm Strip Trials

Why Bayesian? Differ from GWR? Which sampler? Why NUTS? One goal, two paths References

・ロト ・ 四ト ・ ヨト ・ ヨト ・ りゃく

What sampler should you use?

NUTS (No U-turn Sampler) [Hoffman et al. , 2014] is an extension to the Hamiltonian Monte Carlo method.

Compared with Gibbs sampling, NUTS has more effective sample sizes and lower autocorrelation that decreased at a faster rate.

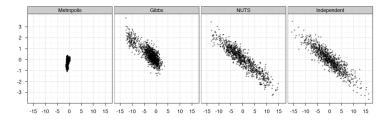

When true heritability was low in the simulated data, the skewness of the marginal posterior distributions with the NUTS was smaller than that with Gibbs sampling [Nishio et al., 2019].

The NUTS is implemented in the R-package: rstan.

On-farm Strip Trials

Why NUTS?

Draws from a highly correlated 250-dimensional distribution (right)

	RW	Gibbs	HMC	NUTS
Conjugation High dimension Divergence risk	Yes Slow High	No Slow Medium	No Fast Low	No Fast Low
Sensitive to step size	High	Medium	Medium	Low

On-farm Strip Trials

Is the Bayesian approach better than GWR?

On-farm Strip Trials

Why Bayesian? Differ from GWR? Which sampler? Why NUTS? One goal, two paths

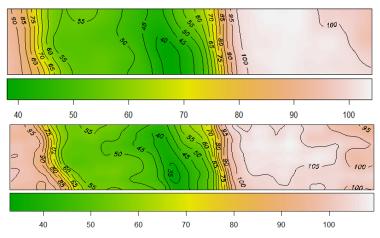

GWR	Bayesian SCRP	F
with neighbouring data higher resolution bandwidth selection maximise local log-likelihood	with all data lower resolution prior specification maximise global log-likelihood	
t scores and <i>p</i> -values	credible intervals PP check and LOO PIT Pareto <i>k</i> diagnostic Bayesian <i>R</i> ²	-

One goal, two paths.

Each has its own advantages.

Are the results different?

Predicted yield with medium nitrogen rate 75.4 kg/ha across the field by GWR (above) and Bayesian SCRP (below).

New research directions

On-farm large scale experiments can have great success in two important research directions, impacting Australian Grains Industry:

- assessment of trait stability; and
- assessment of performance across heterogeneous environment.
